LARSON—MATH 756—CLASSROOM WORKSHEET 11
Modeling Combinatorial Problems with Integer Programs

Review

1. What is a Vertex Packing Integer Program?
2. What is a Vertex Packing Linear Program? (and what is α_f ?)
3. What is important or significant about linear programs?
4. Why is $\alpha \leq \alpha_f$ for any graph?

New

1. Why is $\alpha_f \geq \frac{n}{2}$ for any graph?
2. What other constraints could we add to our IP (and LP) models?
3. What is Balinski's Lemma?
