LARSON—MATH 310–HOMEWORK WORKSHEET 08
Gram-Schmidt and Matrices with Numpy in Jupyter Notebooks.

Set up your JUPYTER notebook for this work.

1. Create a new Jupyter Notebook with Python as the kernel.

   If you don't have a preferred Jupyter Notebooks et-up, use Google Colab (`colab.google.com`), login with your VCU credentials, and use that. It's free, and part of the Google suite VCU pays for. Google Coalb has all the packages we'll need from our text including `numpy` and `matplotlib`.

2. Call this file **310-h08.ipynb**.

3. Make sure you have PYTHON as the *kernel*.

Instructions

1. Open the **Python Companion for VMLS** pdf:

   `https://ses.library.usyd.edu.au/bitstream/handle/2123/21370/vmls-python-companion.pdf` (also linked on the course web page).

2. Run (execute) each code example for Chapters 5, 6 and 10.

3. For each code block, annotate **at least** with the pdf page number of the code block you are running.

Getting your classwork recorded

1. Save your Jupyter Notebook file (`310-h08.ipynb` file).

2. Send me an email (`clarson@vcu.edu`) with an informative header like
   "Math 310 - h08 homework attached" (so that it will be properly recorded and findable when I search for these emails).

3. Remember to **attach** the `.ipynb` file for this assignment.
